Microtiles enable video walls to be built at odd shapes, unlike convention LCD displays. Very eye catching!

Add touchscreen interactivity

Christie Microtiles

With Christie® MicroTiles, you have the ultimate freedom to create a digital display in any size and any shape. Combining the strengths of DLP and LED technology, Christie MicroTiles have higher resolution, brighter images and a much wider color palette than conventional LCD displays. With tiny seams and no practical limit to the number of tiles in a display, Christie MicroTiles produce a nearly seamless canvas of super-fine pixels. Images look amazing at any angle and viewing distance – even close up.

Why Christie MicroTiles

Leading brands and institutions choose Christie MicroTiles because they create a dynamic, rich-media, visual display that outperforms and out lasts other digital display technologies.

Want to incorporate touch screen interactivity into your display? Christie Interactivity Kit is tailor made for Christie MicroTiles. Modular and scalable, this easy-to-use kit transforms your display into a dynamic and responsive multi-touch surface.

Build giant multi-touch walls up to 6.5 metres wide, for a fraction of the cost of the older custom made multi-touch walls.

And, Christie MicroTiles are compatible with a range of industry-leading media servers and image processors – including Christie JumpStart and Christie Spyder X20.

Deep Creek Digital is proud to have produced the first content made Australia for a Christie Microtile wall. It featured on a five by one digital column at Click! Digital in Brisbane.
